Medication Guide

Cyclogest®

Progesterone hormone

Preparation endometrium for embryo transfer

Estrogen hormone

Preparation endometrium for embryo transfer

Cyclogest®

- It can be used both for luteal phase support during pregnancy and for endometrial preparation prior to embryo transfer.
- It is a medication that increases progesterone levels.
- For use in endometrial preparation for embryo transfer: Cyclogest® converts the endometrium from the proliferative phase to the secretory phase, inducing endometrial receptivity for embryo implantation. It also helps reduce uterine contractions after embryo transfer and modulates the immune system to support embryo acceptance.
- For use as pregnancy support: Once pregnancy is established, Cyclogest® helps maintain and stabilize a thick endometrial lining, supporting optimal fetal development.
- Possible side effects include drowsiness, dizziness, headache, nausea, vomiting, mood swings, breast tenderness, and changes in the menstrual cycle, such as spotting.
